

The Community Air Mobility Initiative

A nonprofit organization founded to support the responsible integration of aviation into communities

The Community Air Mobility Initiative (CAMI) is a 501(c)(3) nonprofit organization founded to support the responsible integration of urban air mobility into communities through education, communication and collaboration. CAMI connects communities and industry by providing resources to decision makers, the public, and the media at the state and local level. CAMI is supported by its members, which represent a wide spectrum of stakeholders in the emerging urban air mobility industry. CAMI is dedicated to providing communities and the decision makers that support them with the information and tools that will be vital to the successful integration of aviation into our daily transportation options.

New technologies and new aircraft promise to make flight accessible and practical on a daily basis for more people than ever before. With that promise comes the responsibility to integrate these aircraft into our communities safely, responsibly, and equitably. A successful urban air mobility system requires the integration of the third dimension into existing urban and regional transportation systems that are currently fraught with their own challenges, including traffic congestion, urban sprawl, environmental impacts, and noise. For urban air mobility to succeed, it must be safe, quiet, and a desired component of our communities. CAMI recognizes that this success requires the collaboration of many stakeholders, including elected officials, urban planners, transportation agencies, developers, business owners, and essential services.

As the aviation industry continues to mature the technologies needed to bring electric aircraft into communities, it has become clear that it is vitally important to bridge the work of the industry with the local communities where this technology will be implemented. CAMI's strategic priorities include education, outreach, collaboration, public relations, and model policy development. CAMI has a team of experts in the fields of urban air mobility, electric aircraft, sustainability, infrastructure, operations, markets and community acceptance who contribute to the resources CAMI develops. CAMI also works closely with other industry associations to collaborate on these issues.

CAMI understands the importance of working with all of the stakeholders to develop urban air mobility that integrates with existing and future urban and regional transportation systems. CAMI's members include aircraft manufacturers and suppliers, operators, industry associations, state and local agencies, ecosystem members, academia, and nonprofits. CAMI's members prioritize safety and have a demonstrated desire to be a good neighbor within their communities. Members recognize the importance of working with local communities and support CAMI in providing resources to decision makers, agencies and the public, as well as assisting the aviation industry in understanding those community needs.
